**The transition in-between temporary organizations:
Factors enabling economies of recombination**

Date : 08/02/2018

The transition process from one temporary organization to another can be a source of shared value for the territory in the context of clusters. To date, the temporary organization theory focused on the transition within the project and from a temporary organization to a permanent one. Based on 67 interviews with inter-organizational project managers and four clusters, this research explores the factors influencing the transition process from one project to another. Results identify three categories of eleven factors favoring or hampering this process: structural factors, which emerge from the first temporary organization; conjectural factors, that have a transversal effect throughout the transition; and frictional factors that are specifically empowered during the transition in-between two temporary organizations. We contribute to the temporary organization theory by enlarging the scope of the transition concept and by identifying how clustered firms can jointly benefit from economies of recombination.
